You have submitted the following abstract to Goldschmidt2022. A confirmation email has been sent to the submitter and all named authors. Receipt of this notice does not guarantee that your submission was complete or free of errors.

Abstract Title: Geochemical Compositional Changes due to Fracturing Fluid Interaction with Caney Shale, South Central Oklahoma, USA

Authors (presenting author in bold): Gabriel A Awejori, Oklahoma State University, Nicolas F Spycher, Lawrence Berkeley National Laboratory, Thomas J Paronish, National Energy Technology Laboratory and Mileva Radonjic, Barrier Materials and Geomimicry Lab, School of Chemical Engineering, Oklahoma State University

Abstract Text:

Unconventional shale reservoirs in the North America are characterized by high clay compositions which influence their reactions with drilling and fracturing fluids considerably. These minerals react with engineered fluids with adverse consequences on petrophysical properties of reservoirs. Knowledge of reaction process and the products of reaction of clay minerals with engineered fluids is therefore a significant consideration in development of unconventional reservoirs.

In this study, selected portions of 650 feet core of retrieved the Caney Shale is investigated to understand the mineralogy and geochemical response to fracturing fluids with focus on clay minerals. Petrophysical logs from the well are used to delineate zones of interests, specifically pay zones where rock-fluid geochemical reactions are critical. Batch reactor experiments are conducted at reservoir temperature (95°C) and ambient pressure using the following fluids: 2% Potassium Chloride; 0.5% Choline Chloride solutions and; deionized water used as control.

X-Ray Diffraction (XRD) and Inductively Coupled Plasma Mass Spectrometry (ICP-MS) are employed for mineralogical composition and effluent analysis respectively. Scanning Electron Microscopy/Energy Dispersive Spectroscopy (SEM/EDS) is used to assess the elemental changes from reaction between rocks and fluid samples. Computed Tomographic scanning and X-Ray Fluorescence of

the entire core length are used to upscale results from batch experiments. Geochemical modeling of batch reactor experiment is undertaken with TOUGHREACT software to help corroborate and extrapolate results obtained from batch reactor experiments.

Preliminary results from XRD show samples have identical mineralogical compositions, mainly quartz, carbonates and clays, but different quantities. Elemental compositions of effluent are mainly influenced by the carbonate and clay minerals. Carbonate minerals release ions in solution by dissolution whilst the leading mechanism of ion contribution from clays is by ion exchange. Experimental data and modeling results converge for pH and some elemental compositions, though there is significant divergence in other elements notably, Aluminum (fig. 1).

Our research provides multi-scale, multi-dimensional understanding of geochemical responses of Caney formation to hydraulic fracturing fluids. Results from this study contributes to understanding mechanisms of subsurface rock-fluid interactions. This helps to optimize fracturing fluid compositions for hydraulic fracturing projects within the Caney formation.

8a: Geologic interfaces in sedimentary basins – Key drivers of energy and mineral resource occurrence, recoverability, and storage

Submitter's E-mail Address:

gabriel.awejori@okstate.edu

Submitter Full Name:

Gabriel Awejori

Preferred Presentation Style:

Oral

Conference Attendance:

Onsite

Submission Permission and Copyright:

I grant non-exclusive copyright for my abstract and any related uploaded content to the Conference Exchange and the conference owners. I give permission for my details to be stored in the conference database. I, and the presenting author (if different than the submitter), agree to be contacted by the conference organizers about this submission. I agree to the recording and online streaming of any presentations scheduled as a result of this submission. I confirm all listed authors have agreed to these terms.

Keywords:

Caney, Geochemistry and Shale

If necessary, you can make changes to your abstract submission up until the abstract submission deadline on 1 March 2022 (23:59 CET).

To access your submission in the future:

- If you are listed as an author on this abstract, you can access the submission via 'My Goldschmidt' on the Goldschmidt2022 website.
- If you are not listed as an author, use the direct link to your abstract submission given in one of the automatic confirmation emails that were sent to you during the submission. Note that you will need to log in to your Goldschmidt2022 account to access the submission.

Any changes that you make will be reflected instantly in your submission. You DO NOT need to go through all of the submission steps again in order to change just one part. For example, if you want to change only the abstract title, go to the submission, click on the "Details" tab in the abstract submission menu, edit the title, and then click on save/submit on that step and your changes will then be saved.

Help and Contacts

For any technical queries related to your submission, your Goldschmidt account, or use of the online submission system or website, please contact goldschmidt@confex.com.

For any queries related to the science program in general, please contact scienceprogram@goldschmidt.info.

When you have completed your submission, you may close this browser window.
